

Hello Macro.

The fast new productivity suite.

The productivity suite is the most important B2B SaaS.

Email, documents, and PDFs form the bedrock of knowledge work.

Professional services run on office software.

The financial system runs on *xlsx*. Law and business needs *docx* to get deals done. Banking and consulting is all about pretty *pptx*. And everybody runs on *email* and *pdf* attachments.

Let's face it

External communication still lives in email and attachments.

This is not a bad thing! When working across organizations, email and PDF/Office attachments are a common language.

The problem

Current office suites create chaos and siloed information.

17 simultaneous email threads, 14 different proposal versions, people missing from CC, client_version_final_final_v3.pdf.

But can we really change anything?

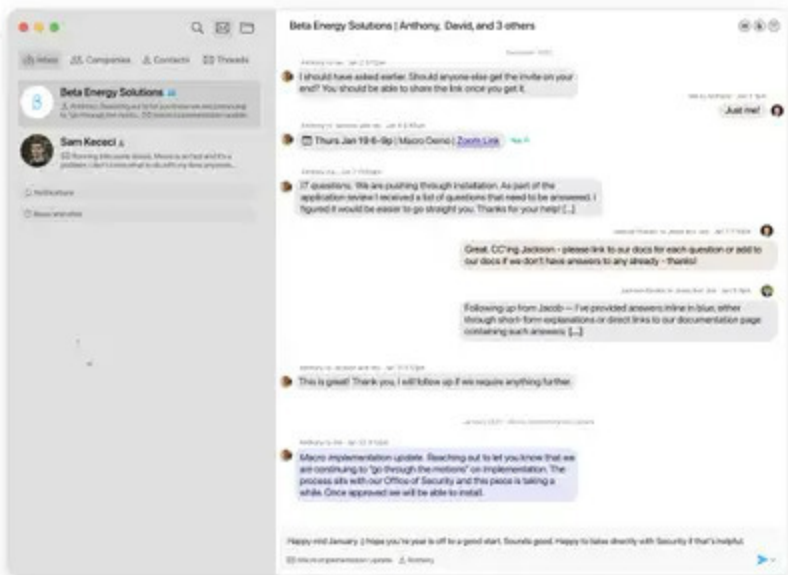

PDFs, Office, and email have *massive network effects*.

What if we could *upgrade* these old formats and apps?

Email, calendar, PDF, and Office documents are all “extensible” formats. That means they can be upgraded while maintaining backwards compatibility.

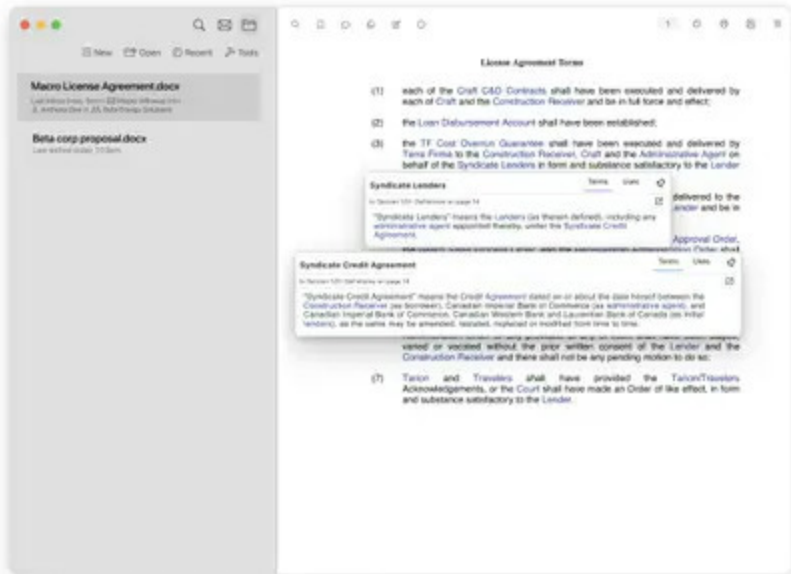

What if email was chat?

fast · friendly · collaborative

What if documents were like webpages?

hyperlinks · tabs · popups

What if *everything* and *everybody* were in sync?

Macro.com

Forward thinking. Backward compatible.
